TARGET TITLE: Full Stack Developer | AI & Automation Enthusiast

PROFESSIONAL SUMMARY:

As a final-year Computer Engineering student, I love building practical, full-stack applications that solve actual problems, whether that means helping people break digital addictions or streamlining recruitment with AI. I focus on creating clean, scalable architectures using modern tools like Next.js, TypeScript, and Spring Boot. I actively use LLMs like Claude to accelerate my development velocity, learn new patterns, and ensure my code aligns with current industry standards. I'm looking for a role where I can build impactful software, work with AI integrations, and continue growing as an engineer.

EDUCATION:

- **B.Tech in Computer Engineering with AIML Honors** – Don Bosco College of Engineering, Fatorda, Goa | 2022–2026 | CGPA: 8.30 (Till 7th Semester)
 - **Relevant Coursework:** Data Structures, Data Science & Analytics, Data Mining, Machine Learning
-

TECHNICAL SKILLS:

- **Languages:** TypeScript, JavaScript, Java 21, PHP, Python, HTML5, CSS3
 - **Frontend Frameworks:** Next.js 15 (App Router), React 18, Angular 20, Tailwind CSS, shadcn/ui, Radix UI
 - **Backend & Databases:** Spring Boot 3.5.5, Supabase (PostgreSQL with RLS), MySQL, Capacitor SQLite
 - **AI & APIs:** Google Gemini 2.5 Flash, OpenAI API, NextDNS API
 - **Tools & Infrastructure:** Clerk Auth, Vercel, Docker, Git, Postman, Polar (Payments), Playwright (e2e)
-

PROFESSIONAL EXPERIENCE & ACADEMIC PROJECTS:

Bodhami | Software Engineering Intern | Jul 2025 – Sep 2025 (2 months)

Location: Malbhat, Madgaon, Goa

- Completed structured training in Business Analysis fundamentals — ADA compliance, AS-IS/TO-BE process flows, swimlane diagrams, customer needs analysis, and HLR/DLR documentation — applied across hands-on case study exercises.
- Trained in Agile delivery practices including backlog creation, estimation, release planning, user story cards with acceptance criteria, and comparative study of Waterfall, Iterative, and V-Model SDLCs.
- Built full-stack development foundations: Angular (components, forms, responsive UI, routing, REST API integration) and Spring Boot with Java/MySQL (REST API framework setup, debugging); introduced to AWS Cloud Infrastructure.
- Applied the training end-to-end on the final-year capstone project below — owning project planning, MVP roadmap, wireframes, screen flow diagrams, and API documentation.

Bodhami | Final Year Project Lead

Project: AI Resume Screening & Shortlisting Tool

Tech Stack: Spring Boot 3.5.5 (Java 21), Angular 20, MySQL, Google Gemini 2.5 Flash

- Led a student engineering team to design and develop a dual-portal recruitment system as a final-year academic project, allowing candidates to upload resumes and recruiters to manage job postings.
- Integrated Google Gemini 2.5 Flash to automatically parse candidate resumes into structured profiles and generate highly detailed job descriptions.
- Designed a cost-efficient application flow: utilised local keyword matching for initial candidate applications (saving API costs), while reserving on-demand, deep AI analysis for top-tier shortlisted candidates.
- Managed backend architecture including MySQL database design, BCrypt password hashing, and REST API routing for authentication, jobs, and resumes.
- Drafted a corresponding IEEE research paper detailing the platform's AI architecture and parsing methodologies.

FEATURED PROJECTS:

Dopamine Detox (Production-Grade SaaS)

Tech Stack: Next.js 15, TypeScript, Supabase, Clerk, NextDNS API, Polar, Vercel

- **Network-Level Blocking:** Built a digital wellness app that connects to the NextDNS API to block distracting domains and categories (Social Media, Gaming) across all devices on a user's network, preventing easy bypasses via backend-managed profiles.
- **Behavioral Friction Engine:** Developed a 3-phase "Reflection Wall" triggered before accessing blocked content, requiring users to answer reflection questions and complete a 2-minute physical reset task to promote conscious browsing.
- **Offline-First Habit Tracking:** Engineered a habit-tracking dashboard with a 52-week GitHub-style activity grid, streak tracking, and achievement badges. Implemented IndexedDB for offline data persistence.
- **Secure Architecture:** Implemented PostgreSQL Row Level Security (RLS) to ensure zero cross-user data leakage, paired with Clerk webhooks to seamlessly auto-sync user profiles. Successfully gated premium features using Polar for one-time payments.

Local-First Gym Workout Tracker (PWA)

Tech Stack: Next.js, TypeScript, Capacitor SQLite

- Building a Progressive Web App optimised for offline-first logging of powerlifting metrics.
- Designed a streamlined interface prioritising manual entry for daily nutrition and macronutrients, deliberately bypassing the friction and clutter of automated, generic food databases.

AWARDS & EXTRA-CURRICULAR:

- 1st Place – Mini Technical Project, Kshitij 2024 (Computer Engineering Category)
- 2nd Place – Dub It Competition, Procyon (Voice-over and synchronisation)

CERTIFICATIONS:

- Responsible & Safe AI Systems – NPTEL
- Software Testing (Automation & Selenium Focus) – NPTEL
- The Joy of Computing Using Python – NPTEL
